### TIMING MODES

#### 181 ZR Delay on Make

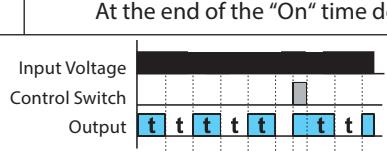

Application of input voltage to the timer starts the time delay. At the end of the delay period, the load is energized. To reset, remove the input voltage to the timer or use control switch.

#### 181 ZN Delay on Break

Input voltage is applied continuously. Upon closure of the normally open live external initiate switch, the load is energized, and remains energized as long as it is closed. When the external initiate switch opens, the time delay is started. At the end of the time delay, the load is de-energized, and the timer is ready for another cycle.

#### 181 BL Repeat Cycle

Application of input voltage to the timer starts the "On" time delay, and energizes the load. At the end of the "On" time delay, the load is de-energized, and the "Off" time delay starts. At the end of the "Off" time delay, the load is again energized, the timer returns to the "On" time delay, and the

cycling continues as long as input voltage is applied. Removal of the input voltage resets the timer.
